

Introduction to Generative AI with AWS

Project Documentation Report

Visit [UDACITY Introduction to Generative AI with AWS Project Documentation Report](#) to make a copy of this document.

Complete the answers to the questions below to complete your project report. Create a PDF of the completed document and submit the PDF with your project.

Question	Your answer:
Step 2: Domain Choice What domain did you choose to fine-tune the Meta Llama 2 7B model on? Choices: 1. Financial 2. Healthcare 3. IT	Healthcare
Step 3: Model Evaluation Section What was the response of the model to your domain-specific input in the model_evaluation.ipynb file?	Myeloid neoplasms and acute leukemias derive from <pre>> myeloid stem cells. These stem cells are located in the bone marrow and are responsible for the production of red blood cells, white blood cells, and platelets. Myeloid neoplasms are characterized by the uncontrolled proliferation of immature myeloid cells in the</pre> ===== Genomic characterization is essential for <pre>> the identification of the causative genes, which is an important step in the development of novel therapeutic strategies. In this study, we aimed to identify the causative genes for congenital heart defects in a large cohort of patients with congenital heart defects.</pre> ===== Certain germline disorders may be

	associated with > an increased risk of developing certain cancers. The National Comprehensive Cancer Network (NCCN) guidelines for genetic testing for hereditary cancer syndromes in adults and children (version 1.2019) recommend that genetic counseling and testing be offered to ===== In contrast to targeted approaches, genome-wide sequencing > of viral genomes allows for the identification of all viral genes that are expressed under a given condition. The first genome-wide viral transcriptome study was performed in 2008, and since then, several groups have identified viral genes that are expressed in a variety of vir =====
Step 4: Fine-Tuning Section After fine-tuning the model, what was the response of the model to your domain-specific input in the model_finetuning.ipynb file?	Myeloid neoplasms and acute leukemias derive from > [{'generated_text': ' a common progenitor and are characterized by the accumulation of genetic lesions in the hematopoietic stem cell compartment. These lesions are associated with activation of signaling pathways that regulate cellular proliferation, differentiation, and apoptosis. The myelop'}] ===== Genomic characterization is essential for > [{'generated_text': ' understanding the diversity of pathogens and for developing effective therapies. However, the high cost and time required for sequencing have limited the application of genomic characterization to pathogenic organisms. In this work, we present a method for identifying and characterizing bacterial strains by extract'}]

	===== Certain germline disorders may be associated with > [{'generated_text': ' an increased risk of developing malignancies, and the prevalence of these disorders may be increased in patients with cancer. However, the association between these disorders and malignancy is not always clear. In this study, we conducted a genome-wide association study (GWAS) to identify'}] ===== In contrast to targeted approaches, genome-wide sequencing > [{'generated_text': ' is a powerful tool for investigating genetic factors that may affect the risk of developing an illness. Genome-wide sequencing can also be used to study the genetic basis of variation in response to therapies or environmental factors.\nWe use next-generation sequencing to analyze genome-wide'}] =====
